Biomes and Presets 4 for MicroVerse

Product Overview

Biomes and Presets for MicroVerse allows you to quickly create your scenes using MicroVerse by dragging pre-defined configurations from the MicroVerse Content Browser on your terrain.

You probably already have a huge collection of assets, the task at hand is how to distribute their content. Jason Booth released MicroVerse recently. MicroVerse is awesome. It's such a quick and easy way to set up a scene in a non-destructive manner. In order to make this task even easier for you the Content Browser was created.

You may consider this asset as a bridge between top quality Unity assets from the Unity Asset Store and MicroVerse. If you have checked out my youtube channel, you can see that I'm all for quick scene creation with all kinds of assets in various categories.

I started creating MicroVerse presets for re-use and shared them with the community. This got awesome recognition and I was asked if I could create presets for other assets as well. As easy as creating those biomes and presets is, it still does take time to set it all up, install assets, test it and what not. That's why I decided to create this dedicated asset.

4

Download

In order to keep everything organized the editions are split between release volumes.

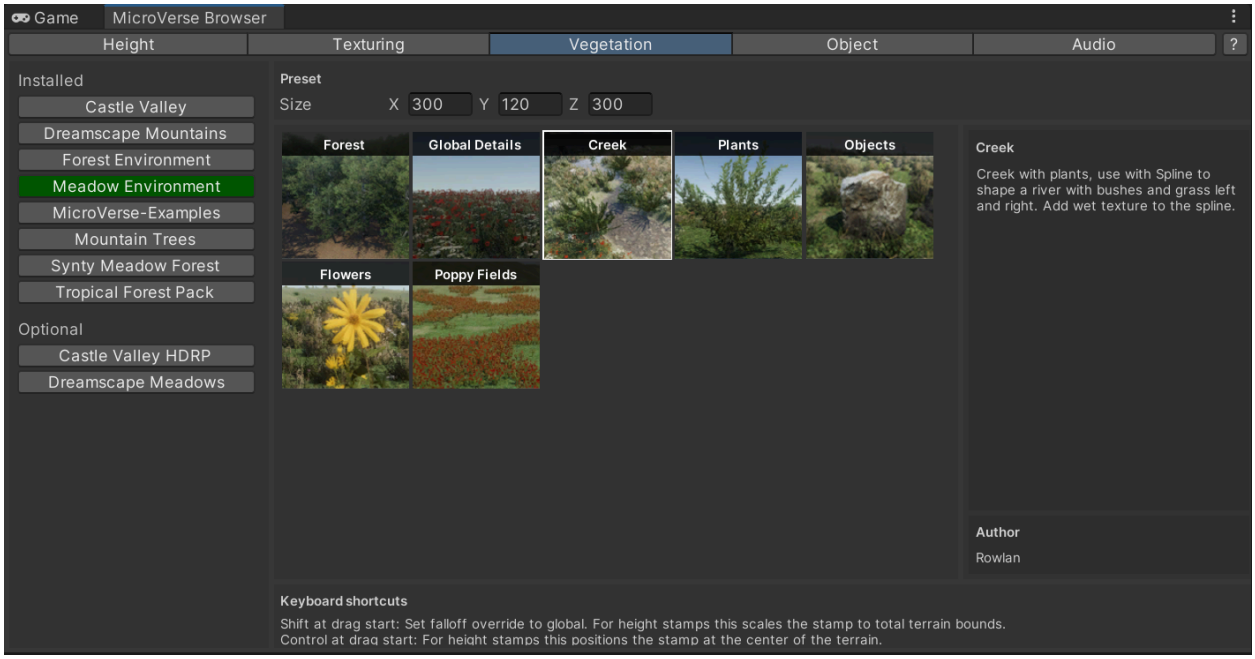
Please assign the asset of your choice to your account on the Unity Asset Store:

- **Biomes and Presets 1 for MicroVerse**
- **Biomes and Presets 2 for MicroVerse**
- **Biomes and Presets 3 for MicroVerse**
- **Biomes and Presets 4 for MicroVerse**

The Asset Store must show those assets as already purchased or free for you.

Quick Start

The Biomes and Presets are automatically discovered by the MicroVerse Content Browser. The available assets will be listed in the Optional category in the content browser. Once a supported asset is installed, the asset will show up in the Installed category. Here's eg Meadow Environment



Once installed, you can proceed as usual with MicroVerse. Please read the MicroVerse documentation about how to use the Content Browser.

Supported Assets

Please take a look at the Asset Store description for a list of supported assets.

Problems & Solutions

Problem

Console error: Problem detected while loading the contents of the Prefab file

Solution

That's just how Unity works. This may occur when you don't have an asset installed that is supported. You can either

- delete the supported asset folder from the Biomes & Presets installation folder
  or
- only install the asset you require presets for
  or
- ignore what just isn't an error

The alternative would be I'd create a single asset per supported asset or create unitypackage files which you'd have to install manually for every single asset. So just hitting the clear button in the console is the solution with the least effort.
